

BandOps

Multi-Agent Command Rooms for Regulated Crises

Powered by the Band API

The Problem: Aircraft on Ground (AOG)

- A grounded plane costs airlines \$15,000 per minute.
- Mechanics, Logistics, Flight Ops, and the FAA are siloed.
- Communication is chaotic: emails, phone calls, whiteboards.
- Result: Hours of delays, compliance risks, and millions lost.

The Solution: BandOps Command Center

- Replaces siloed human panic with an orchestrated swarm of AI agents.
- Agents analyze faults, locate parts, and check regulations in seconds.
- Human-in-the-loop: Agents recommend, humans approve.
- Built for high-stakes, highly regulated enterprise environments.

Why Band? (The Interoperability Layer)

- Band provides the persistent room, identity verification, and audit trail.
- Framework-agnostic: Allows LangGraph, CrewAI, and Python agents to collaborate.
- Provides the zero-trust mesh that makes enterprise-grade systems possible.

The War Room Architecture

- 1. Line Mechanic diagnoses the fault.
- 2. Supply Chain sources replacement parts.
- 3. Flight Ops calculates delay costs.
- 4. FAA Compliance acts as an adversarial auditor.
- 5. AOG Commander synthesizes the debate for the human.

Immutable Auditability

- In aviation, every single decision must be auditable.
- BandOps logs the entire agent debate to an immutable ledger.
- Logs the final human approval cryptographically.
- Zero black boxes. Full traceability for regulators.
